(https://profile.intra.42.fr)

Remember that the quality of the defenses, hence the quality of the of the school on the labor market depends on you. The remote defences during the Covid crisis allows more flexibility so you can progress into your curriculum, but also brings more risks of cheat, injustice, laziness, that will harm everyone's skills development. We do count on your maturity and wisdom during these remote defenses for the benefits of the entire community.

SCALE FOR PROJECT PHILOSOPHERS (/PROJECTS/42CURSUS-PHILOSOPHERS)

You should evaluate 1 student in this team

?

Git repository

?

Introduction
Please respect the following rules:

- Remain polite, courteous, respectful and constructive
throughout the evaluation process. The well-being of the community
depends on it.

- Identify with the person (or the group) evaluated the eventual
dysfunctions of the work. Take the time to discuss
and debate the problems you have identified.

- You must consider that there might be some difference in how your
peers might have understood the project's instructions and the
scope of its functionalities. Always keep an open mind and grade
him/her as honestly as possible. The pedagogy is valid only and
only if peer-evaluation is conducted seriously.

Guidelines
- Only grade the work that is in the student or group's
GiT repository.

- Double-check that the GiT repository belongs to the student
or the group. Ensure that the work is for the relevant project
and also check that "git clone" is used in an empty folder.

- Check carefully that no malicious aliases was used to fool you
and make you evaluate something other than the content of the
official repository.

-        To avoid any surprises, carefully check that both the
evaluatingand the evaluated students have reviewed the
possible scripts used to facilitate the grading.

-        If the evaluating student has not completed that
particularproject yet, it is mandatory for this student to read the
entire subject prior to starting the defence.

-        Use the flags available on this scale to signal an empty
repository, non-functioning program, a norm error, cheating
etc. In these cases, the grading is over and the final grade is 0
(or -42 in case of cheating). However, with the exception of
cheating, you are encouraged to continue to discuss your work
(even if you have not finished it) in order to identify any issues
that may have caused this failure and avoid repeating the same
mistake in the future.

-        Remember that for the duration of the defence, no
segfault,no other unexpected, premature, uncontrolled or
unexpected termination of the program, else the final grade is
0. Use the appropriate flag.
You should never have to edit any file except the configuration file if it
exists. If you want to edit a file, take the time to explicit the reasons with
the evaluated student and make sure both of you are okay with this.

-        You must also verify the absence of memory leaks. Any
memory allocated on the heap mustbe properly freed before
the end of execution.
You are allowed to use any of the different tools available on the computer, such as
leaks, valgrind, or e_fence. In case of memory leaks, tick the appropriate flag.

Mandatory Part

Error Handling

This project is to be coded in C, following the Norm.
Any crash, undefined behavior, memory leak or norm error means 0 to the project.

Yes	No

Philo_one code

- Check the code of philo_one for the following things and ask for explanation.
- Check if there is one thread per philosopher.

- Check if there is a mutex per fork and that it's used to check the fork value and/or change it.- Check if the output is protected against multiple access. To avoid a scrambled view.
- Check how the death of a philosopher is checked and if there is a mutex to protect that a philosopher dies andstart eating at the same time.

Yes   No

Philo_one test

- Do not test with more than 200 philosphers
- Do not test with time_to_die or time_to_eat or time_to_sleep under 60 ms- Test with 5 800 200 200, no one should die!
- Test with 5 800 200 200 7, no one should die and the simulation should stop when all the philosopher haseaten at least 7 times each.
- Test with 4 410 200 200, no one should die!
- Test with 4 310 200 100, a philosopher should die!
- Test with 2 philosophers and check the different times (a death delayed by more than 10 ms is unacceptable). - Test your own values to check all the rules. Check if a philosopher dies at the right time, if they don't steal forks, etc.

Yes   No

Philo_two code

- Check the code of philo_two for the following things and ask for explanation.
- Check if there is one thread per philosopher.
- Check if there is a single semaphore that represents the number of forks.
- Check if the output is protected against multiple access. To avoid a scrambled view.
- Check how the death of a philosopher is checked and if there is a semaphore to protect that a philosopher diesand start eating at the same time.

Yes   No

Philo_two test

- Do not test with more than 200 philosphers
- Do not test with time_to_die or time_to_eat or time_to_sleep under 60 ms - Test with 5 800 200 200, no one should die!
- Test with 5 800 200 200 7, no one should die and the simulation should stop when all the philosopher haseaten at least 7 times each.
- Test with 4 410 200 200, no one should die!
- Test with 4 310 200 100, a philosopher should die!
- Test with 2 philosophers and check the different times (a death delayed by more than 10 ms is unacceptable). - Test your own values to check all the rules. Check if a philosopher dies at the right time, if they don't steal forks, etc.

Yes   No

Philo_three code

- Check the code of philo_three for the following things and ask for explanation.
- Check if there will be one process per philosopher and that the first process waits for all of them.
- Check if there is a single semaphore that represent the number of forks.
- Check if the output is protected against multiple access. To avoid a scrambled view.
- Check how the death of a philosopher is checked and if there is a semaphore to protect that a philosopher dies and start eating at the same time.

☑ Yes   ✗ No

Philo_three test

- Do not test with more than 200 philosphers
- Do not test with time_to_die or time_to_eat or time_to_sleep under 60 ms
- Test with 5 800 200 200, no one should die!
- Test with 5 800 200 200 7, no one should die and the simulation should stop when all the philosopher has eaten at least 7 times each.
- Test with 4 410 200 200, no one should die!
- Test with 4 310 200 100, a philosopher should die!
- Test with 2 philosophers and check the different times (a death delayed by more than 10 ms is unacceptable).
- Test your own values to check all the rules. Check if a philosopher dies at the right time, if they don't steal forks, etc.

☑ Yes   ✗ No

Ratings

Don't forget to check the flag corresponding to the defense

✓ Ok   ★ Outstanding project

■ Empty work   ☹ No author file   ☠ Invalid compilation   ♫ Norme   ☷ Cheat

♣ Crash   💧 Leaks   ⊘ Forbidden function

Conclusion
